

The distribution of collisions, fatalities by road type

The majority of pedestrian and bicyclist collisions and fatalities per mile are on main street highways 2010 through 2012¹; Collisions and fatalities per centerline mile in Washington state

For a description of “main street highways” please see *Gray Notebook 52*, p. 2.

Data source: National Highway Traffic Safety Administration Fatality Analysis Reporting System (FARS); WSDOT Statewide Travel and Collision Data Office.

Notes: 1 2012 data is preliminary. 2 Main street highways comprise less than 10 percent of all state highways, for a total of 614 centerline miles. This graph does not include 18,963 miles of miscellaneous roads (23 percent of total centerline miles statewide), such as those on park lands (there were 32 collisions and no fatalities in 2010 through 2012).
