

# **Eastern Region, Area 3**

---

# **Integrated Roadside Vegetation Management Plan**

2019

**Washington State  
Department of Transportation**  
Maintenance Operations Division

## ***Introduction***

---

The Washington State Department of Transportation's (WSDOT) Eastern Region, Area 3 manages 995 miles of roadside right-of-way throughout Lincoln and Adams counties. The state highway system in this area includes portions of I-90, US2, US395, SR25, and SR21, as well as a number of other secondary state routes. A map of state highways and routes in this area is included as **Figure 1** on the following page.

The primary roadside vegetation management objectives are in relation to traffic safety and preservation of the highway infrastructure. Additionally, as a landowner WSDOT is required to control all listed noxious weeds that occur on the right-of-way by state law (RCW 17.10 and 15.15.010). It is important that WSDOT not only meet the legal requirements for weed control, but also consider the needs and concerns of adjacent landowners in this area.

In order to best manage roadsides with these priority objectives in mind, WSDOT practices an annually cycling process called Integrated Vegetation Management (IVM). Plans like this are maintained and updated annually for all areas of the state with an overall goal of establishing the most naturally self-sustaining roadsides vegetation possible. Adjustments are made year to year in each area plan based on monitoring the previous years' accomplishments and results, available budget, and prioritization of other highway maintenance activities.

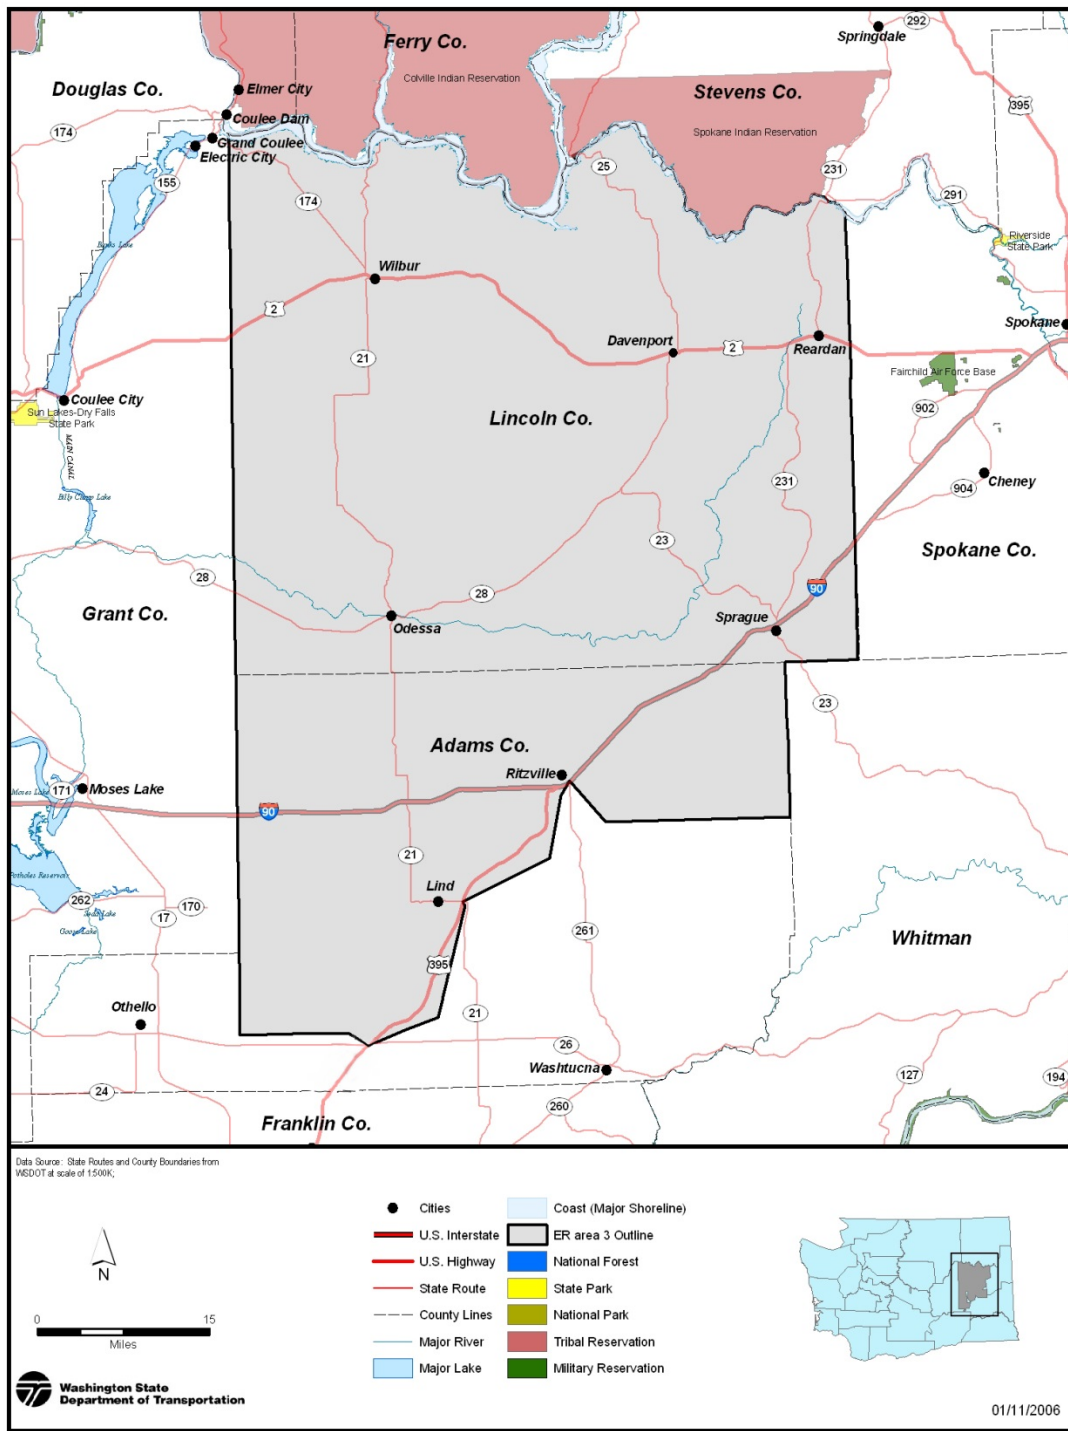

This plan serves as the guidance document for vegetation maintenance in Eastern Region Area 3 for the 2019 growing season. It identifies priority locations and prescribes treatments for accomplishing safety and weed control objectives through the use of a combination of seasonally-timed control measures. Each year's actions are designed as part of a coordinated multi-year strategy to minimize roadside maintenance requirements wherever possible. This plan also accounts for specific locations where maintenance tactics are adjusted due to environmental issues, neighboring properties, local partnerships, or restoration work done through WSDOT design and construction.

As of the 2019 season, the information contained in this plan document can be geographically referenced by crews in the field using iPads and the Highway Activity Tracking System (HATS). Accomplishments and results will also be tracked geographically through this new system. This development in WSDOT maintenance management will greatly improve the agency's success in properly executing planned actions, monitoring and documenting results of treatments, and in measuring cost and results over time.

WSDOT welcomes input from local public and private entities on its weed control and other vegetation management activities. Wherever appropriate the agency is looking for opportunities to plan and cooperate with others in managing the roadside. Please direct any questions, comments or suggestions to the Eastern Region Area 3 Superintendent – Doug Bierce, or the State's Roadside Asset Manager – Ray Willard.

## ***Eastern Region Area 3 IVM Work Plan – 2019***

---

The section outlines the overall approach and geographic distribution of roadside vegetation management requirements throughout the maintenance area in 2019. Information is organized in relation to three major groups defined in the WSDOT Maintenance Accountability Program (MAP) for the performance of roadside vegetation maintenance activities: **Control of Vegetative Obstructions**, **Noxious Weed Control**, and **Nuisance Weed Control**. Specific locations as noted in this work plan are also mapped in the Highway Activity Tracking System (HATS) for reference by maintenance in the field.

### **Control of Vegetative Obstructions – 3A4**

The work of this group of maintenance activities relates to the safety and operational requirements of the highway. These items are considered first priority in terms of the overall roadside maintenance needs. Vegetation management objectives and work activities in this category fall into four groups – **Pavement Edge Maintenance/Zone 1**, **One Pass Mowing/Zone 2**, **Tree and Brush Control/Zone 2 and 3**, and **Hazard Tree Removal/Zone 3**.

#### **Pavement Edge Maintenance/Zone 1**

**Work Operation: 1615**

**HATS Form: Pesticide Application**

**HATS Map Layer: Reference lines – Roadside Features/Spray Zone 1 Reference**

This work includes the application of herbicides to road shoulders where necessary throughout the area. The objective of these applications in designated locations is preserving of a band of gravel shoulder adjacent to the pavement that is free of vegetation. This treatment is necessary in the mapped locations described below to provide visibility and maintainability of roadside hardware and guideposts, allow room for vehicles to safely pull off on shoulders, facilitate stormwater drainage, and/or provide added visibility of wildlife approaching the highway.

#### **Total Units of Planned Treatment**

- Apply approximately **600 acres** of herbicide treatment to road shoulders throughout the area.

#### **Locations of Planned Treatments**

- Planned treatments are mapped in HATS layer – **Zone 1 Treatments**.
- All shoulders in the area will be treated with a 4' width banded application of soil residual and non-selective herbicides.
- Spring residual treatments will be made to all shoulders on the following routes:
  - I-90, SR395, SR231, SR28, SR23, and SR21
- Fall residual treatments will be made to all shoulders on the following routes:
  - SR21, US2, SR23, SR25, SR28, SR174
- SR231, MP 35.5-39.5 is a sensitive area along the creek, and will be treated with Glyphosate only @ 32 oz./acre, once or twice as needed during the growing season.

#### **Treatment Methods**

- Herbicides are applied using a truck mounted power spray system calibrated to deliver a 4-foot band of spray mixture on a flat surface adjacent to the paved shoulder. The resulting width of treated shoulder may be wider than 4 feet in areas with steeper shoulder slope.
- Spring treatment mixture:
  - Milestone @ 7 ozl/acre
  - Esplanade @ 5 ozl/acre
  - Roundup Pro Concentrate @ 32 ozl/acre

- In Place @ 16 oz./acre
- Climb @ .32 oz./acre
- Fall treatment mixture:
  - Esplanade @ 7 oz./acre
  - Sulfomet @ 5 oz./acre
  - In Place @ 16 oz./acre
  - Climb @ .32 oz./acre
- Ritzville Interchange treatment mixture:
  - Crosshair @ 4 oz./acre
  - Rangestar @ 1 qt./acre
  - Perspedctive @ 4 oz./acre
  - Portfolio @ 10 oz./acre
  - Bronx Max @ 4 oz./ 100gl water

**Safety Mowing/Zone 2**

**Work Operation: 1625**

**HATS Form: Mowing Zone 2**

**HATS Map Layer: Reference lines – Roadside Features/Mowing Zone 2 Reference**

This work includes routine mechanical cutting of all vegetation on the road shoulder in a band width immediately adjacent to pavement. Mowing is necessary in areas where taller growing grasses or other vegetation are present and must be annually or semi-annually cut back for visibility and maintenance of roadside hardware and delineators, to maintenance traffic sight distance at curves and intersections, controlling snow drift, and for improved visibility of wildlife approaching the highway. Mowing height for these operations is typically 6 to 8 inches above the ground.

Total Units of Planned Treatment

- Less than **8 acres** in select locations throughout the area

Locations of Planned Treatments

- SR 90, MP 219 – 222 / Mowing in the interchange area

Treatment Methods

- Tractor mounted mowing deck

**Tree and Brush Control/Zone 2 and 3**

**Work Operations: 1622, 1625, 1626**

**HATS Forms: Pesticide Application for spray applications, and three sub-forms under Tree/Brush Control –Trimming Mechanical, Trimming Manual, and Mowing**

**HATS Map Layer: None**

This includes safety and traffic operations related work in Zone 2, such as periodic side-trimming or pruning of brush and trees or tree branches behind guardrail, encroaching on or overhanging traffic operations, and/or impacting sign visibility. Also included is work in Zone 2 and 3 when selectively controlling emergent early succession tree species – to prevent them from growing into mature hazard trees within striking distance of the road.

Total Units of Planned Treatment

- Less than **10 acres** will be treated throughout the area.

Locations of Planned Treatments

- SR 174, MP 27-29
- SR 21, MP 99-102
- SR 25, MP 17-19
- SR 231, MP 36-39

Treatment Methods

- Trim with hand tools as necessary

### **Hazard Tree Removal/Zone 3**

**Work Operation: 1628**

**HATS Forms: Hazard Tree Removal – Individual Tree Removal, Stand Removal, and Cleanup Fallen Trees**

**HATS Map Layer: None**

Trees within and adjacent to the right of way are routinely monitored by maintenance staff for potential risk to the highway and/or neighboring structures. Individual and stands of trees exhibiting structural or health defects and identified as a potential imminent threat are removed as soon as possible.

#### **Total Units of Planned Treatment**

- Less than **25 trees** per year on average

#### **Locations of Planned Treatments**

- All trees in the area will be continually evaluated for risk to the highway and adjacent property and removed as necessary.

#### **Treatment Methods**

- Cut with chain saws
- Leave debris to decompose on site when appropriate, or removed to nearby out of sight locations.

### **Noxious Weed Control – 3A2**

This group of activities includes control of non-native invasive weed species as defined by state law and individual county designation. This group of activities is second priority vegetation management work after safety related objectives have been addressed. While all Class A, B, and C noxious weed species as listed in RCW 17.10 are considered potential targets for WSDOT noxious weed control, the agency is currently not funded to achieve 100% control of all noxious weeds. Therefore, the top priorities for weed control are focused on locations and species that are more limited in distribution on the right of way – where there is a chance of successful eradication. To prioritize control of species that are already widespread in the area, WSDOT works with the local county noxious weed boards and coordinators, to annually review and determine which species and locations will be specifically targeted.

To prioritize, plan, and track noxious weed control, WSDOT maps and monitors weed infestations in three categories: **Priority**, **Planned Treatment**, and **General Reference**. **Priority** locations are where Class A noxious weed species exist on the right of way, and complete eradication is required by state law. **Planned Treatment** sites are locations where there are new, and/or limited distribution infestations of Class B and C noxious weed exist, and eradication is possible. **General Reference** sites are recorded for reference only to document the presence of noxious weed species which are more commonly occurring in the local area.

#### **Noxious Weed Control**

**Work Operations: 1616, 1618, 1641, 1699**

**HATS Forms: Pesticide Application (for spray applications,) and three sub-forms under Noxious Weed Control General– Manual/Mechanical, Seed/Fertilize/Mulch, and Biological**

**HATS Map Layer: Reference Points – Roadside Features/Noxious Weed Control Priority, Noxious Weed Control Planned Treatment, and Noxious Weed Control General Reference**

Operations are prescribed throughout the season to prevent the spread of any legally designated noxious weed species, and to reduce or eliminate populations wherever possible. Integrated treatment plans combine field monitoring and an

integral mixture of seasonally timed control methods with proven effectiveness on designated species. Successful plans are consistently implemented over a series of years and annually adjusted as necessary based on field observations. Care must be taken in all cases to avoid damage to surrounding desirable/native vegetation.

#### Designated Species Known to Exist on WSDOT Right of Way

- See **Appendix A** for a list target weed species and notes describing treatment of each species

#### Total Units of Planned Treatment

- Approximately **900 acres** will be treated with herbicides
- Less than **5 acres** will be pulled by hand

#### Locations of Planned Treatments

- Many designate species are present throughout long stretches of corridor and will be treated throughout the area when visible in spring and early summer, prior to seed production whenever possible.
- The area crews will be using HATS to map points where highest priority reoccurring infestations occur during the 2019 season, treatment strategies for these sites will then be developed for implementation beginning in the 2019 growing season.

#### Treatment Methods and Timing

- Treatment notes for all target species are included in **Appendix A**
- Treat throughout the area when visible in spring and early summer, prior to seed production whenever possible.
- Herbicide mix for early season treatments:
  - Opensight @ 3 oz./acre
  - SylTac @ 2 oz./acre
- Herbicide mix for mid-season treatments:
  - Weedmaster @ 32 oz./acre
  - Climb @ 1 oz./acre
  - In-Place @ 16 oz./acre

### **Nuisance Vegetation Control – 3A3**

Nuisance vegetation control takes place only in a select set of carefully prioritized locations throughout the area. These locations are delineated on maps in HATS as polygon outlines in Zone 3. Locations are prioritized to take place where there is heightened local interest in the visual appearance and condition of the roadside vegetation. Typical locations include: wider areas along limited access freeways in urban and suburban areas, freeway interchanges for local urban centers, environmentally sensitive areas, and areas where neighbors are willing to partner with WSDOT on management efforts. Because nuisance weed control activities are not related to safety or legal requirements, and are primarily undertaken to improve the visual appearance of the roadside, they are considered the last priority vegetation management needs.

For all areas designated to receive Nuisance Vegetation Control, multi-year treatment plans have been developed. The actions contained in these plans will be executed and tracked in relation to specific Zone 3 polygons for **Nuisance Vegetation Control Zone 3**, referenced on HATS maps and described below.

#### **Nuisance Vegetation Control**

**Work Operations: 1611, 1612, 1641, 1699**

**HATS Forms: Pesticide Application (for all spray applications), and 3 sub-forms under Nuisance Veg. Control General – Manual/Mechanical, Biological, and Seed/Fertilize/Mulch**

**HATS Map Layer: Reference polygons – Zone 3 Nuisance Reference**

Maintenance activities in each identified location are planned and tracked as multi-year treatment strategies utilizing monitoring and the most effective combination of control methods – with a goal of establishing desirable vegetation that requires only minimal maintenance. Care must be taken in all cases to avoid damage to surrounding desirable/native vegetation. In some cases, soil enhancements may be used as well as seeding or planting of beneficial competition species. Successful plans are consistently implemented over a series of years and annually adjusted as necessary based on field observations.

#### Total Units of Planned Treatment

- Approximately **10 acres** of nuisance weed species will be treated with herbicide.

#### Locations of Planned Treatments

- I-90, Ritzville and Sprague interchanges

#### Treatment Methods and Timing

- Evaluation of last year's treatments will be conducted in spring when weed rosettes are visible.
- Spot spray 2 to 3 times between May and July for emergent kochia and Russian thistle.

## Noxious Weed Targets on WSDOT Right of Way in Eastern Region Area 3:

<b>Common Name/Botanical Name</b>	<b>Treatment Notes</b>
Buffalobur ( <i>Solanum rostratum</i> )	Occasional occurrence, usually escapes from bird feeders. Control where visible in conjunction with summer seasonal weed patrols.
Bugloss, Annual ( <i>Anchusa arvensis</i> )	Mainly on SR231, sites will be mapped and treated in the spring.
Bugloss, Common ( <i>Anchusa officinalis</i> )	Mainly on SR231, sites will be mapped and treated in the spring.
Johnsongrass ( <i>Sorghum halepense</i> )	All known infestations have been controlled and mapped for continued monitoring of regrowth.
Meadow sp. ( <i>Centaurea jacea</i> )	Control where visible in conjunction with summer seasonal weed patrols
Knapweed, Russian ( <i>Acroptilon repens</i> )	SR2, 21, 23, 25, 28, 231, 174 sites will be mapped and treated in the spring.
Knotweed, Japanese ( <i>Polygonum cucpidatum</i> )	SR2 – Stormwater pond near Davenport is the only known occurrence. Site will be mapped but has been controlled in previous years and is being monitored for regrowth.
Kochia, ( <i>kochia scoparia</i> )	Control where visible in spring follow up to Zone 1 treatments
Leafy Spurge ( <i>Euphorbia esula</i> )	SR2 and SR231 have infestations that will be mapped and treated in the spring, and treated again in the late summer if there is regrowth
Perennial Pepperweed ( <i>Lepidium latifolium</i> )	Known infestation sites will be mapped and treated in conjunction with summer weed patrols.
Perennial Sowthistle ( <i>Sonchus arvensis</i> ssp.)	Control where visible in conjunction with seasonal weed patrols.
Puncturevine ( <i>Tribulus terrestris</i> )	Weed boards will help with control and mapping reoccurring infestation sites.
Rush Skeletonweed ( <i>Chondrilla juncea</i> )	Control where visible in conjunction with seasonal weed patrols, map outlying infestation sites for control in spring of 2019.
Thistle, Musk ( <i>Carduus nutans</i> )	Weed boards will help with control and mapping reoccurring infestation sites.
Thistle, Scotch ( <i>Onopordum acanthium</i> )	Weed boards will help with control and mapping reoccurring infestation sites.
Toadflax, Dalmatian ( <i>Linaria dalmatica</i> )	Bio controls are working well on this plant in most areas. Only target if plants are not being impacted by bio-control agents.
Yellow Starthistle ( <i>Centaurea solstitialis</i> )	Weed boards will help with control and mapping reoccurring infestation sites.
