

SR 520 BRIDGE REPLACEMENT AND HOV PROGRAM

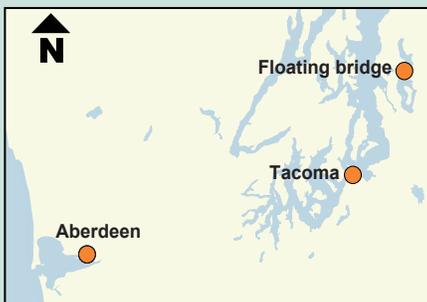

Massive pontoons support the new SR 520 floating bridge

Building a safer SR 520 floating bridge

The old four-lane SR 520 floating bridge on Lake Washington was vulnerable to windstorms. Studies showed that the aging bridge could break apart in a severe storm. Moreover, without shoulders or lanes for carpools and transit, the cross-lake bridge created daily delays for commuters. At more than 50 years old, the bridge needed to be replaced.

As part of the SR 520 Bridge Replacement and HOV Program, the Washington State Department of Transportation (WSDOT) built a new, six-lane floating bridge – one that can move more people more reliably and withstand stronger windstorms and waves. The new bridge opened to traffic in April 2016.

The backbone of the new bridge is its pontoons – 77 massive, concrete structures that will keep the new, wider bridge stable and afloat.

SR 520 pontoon and floating bridge construction sites

An aerial view (top) of pontoons under construction at the Grays Harbor casting facility; an ironworker (lower-left), perched three stories above the concrete floor of a pontoon, fastens rebar for the pontoon's wall; a 75-foot-wide pontoon (lower-right) squeezes through the Hiram M. Chittenden Locks in Seattle.

Crews wrap up pontoon construction in March 2015

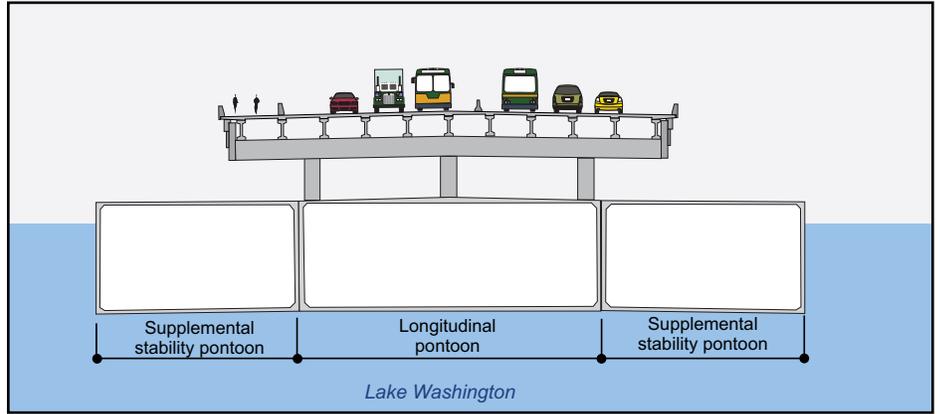

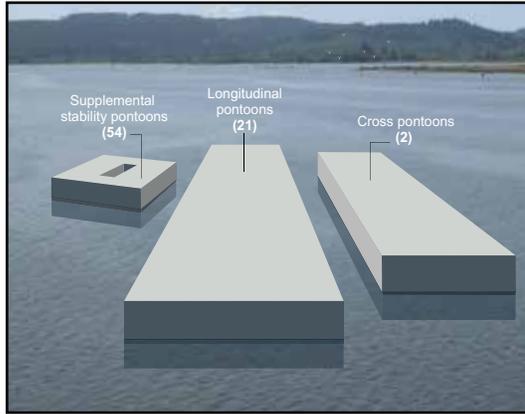

The effort to build pontoons for the new, 1.5-mile-long floating bridge began in early 2011 with the construction of a casting facility in Aberdeen. Late that year, crews started building the first of 33 pontoons to be built in Grays Harbor. Construction of the bridge's 44 other pontoons also began in late 2011 at a facility at the Port of Tacoma. Construction in Tacoma wrapped up in late 2014, and in March 2015 in Aberdeen.

Built in cycles of six to eight pontoons at a time, the first completed cycles floated out of the Aberdeen and Tacoma casting basins in mid-2012. At the peak of construction, more than 650 workers – steelworkers, carpenters, concrete specialists, welders, crane operators, and others – were on the job building pontoons between the two locations.

In mid-2014, crews on Lake Washington began aligning and joining the immense, longitudinal pontoons – using 80 bolts, each up to 20 feet long and 800 pounds, to fasten each pontoon joint. The pontoons were then anchored in their final positions on the lake.

Pontoons – the foundation of a floating bridge

Bridge pontoons are the foundation of a floating bridge. These massive, hollow, concrete boxes are designed to support the weight of the road and the cars, trucks, buses, bicyclists and pedestrians that use the bridge every day. The largest, longitudinal pontoons for the SR 520 bridge, all built in Aberdeen, are 360 feet long – as long as a football field. Each one weighs a little more than 11,000 tons – roughly equal to 23 Boeing 747 jets. Constructing all 21 of these jumbo pontoons required 112,000 cubic yards of concrete, 35,000 tons of steel rebar, and 2.7 million square feet of plywood formwork. The bridge's 54 supplemental stability pontoons, roughly one-third of the size of the larger pontoons, give the bridge added stability and flotation.

A pontoon's voyage to Lake Washington

After each cycle of concrete and steel pontoons was constructed in one of the two water-free casting basins, large gates opened to flood the basin. The pontoons – usually six or eight in a cycle – were then floated and towed out, either into the Chehalis River at Grays Harbor or Commencement Bay in Tacoma. Inspectors then thoroughly examined each pontoon, inside and out – even underwater – to ensure it met the bridge's 75-year design standard. Finally, the pontoons were towed, by tugboat, to Lake Washington. Depending on ocean conditions, the 260-nautical-mile journey from Grays Harbor to Lake Washington took about four or five days. The shorter trip from Tacoma took less than a day.

An Aberdeen-built longitudinal pontoon, guided by tugboats, crosses Seattle's Lake Union en route to Lake Washington.
