19.0 Information on Listed Species

This chapter contains the following information:

- Listed species in Washington under USFWS and NMFS jurisdiction
- Working with listed salmonids—considerations and resources
- Wildlife sensitive periods calendar
- Identification window for threatened and endangered plants in Washington
- Recovery plans

19.1 Listed Species in Washington under Jurisdiction of USFWS and NMFS

Species lists can be obtained or generated for species within Washington State from the following websites:

- NMFS
  https://www.fisheries.noaa.gov/species-directory/threatened-endangered
- USFWS  Washington Fish and Wildlife Office
  <http://www.fws.gov/wafwo/species_new.html>

Species lists and listing information can also be found on the WSDOT Biology website at:

---

a  There is much variation in life history patterns—each stream system having fish with their own unique timing and patterns of spawning, growth, and migration. Ask a local biologist about the specific patterns of the fish in your streams and update this chart for your area.

b  The eggs of most salmonids take 3-5 months to hatch at the preferred water temperature of 50-55 degrees F; steelhead eggs can hatch in 2 months.

c  Steelhead, unlike salmon, may not die after spawning. They can migrate back out to sea and return in later years to spawn again.

Left intentionally blank for future updates.

19.4 What Constitutes Harm to Endangered and Threatened Wildlife and Plants Under the ESA?

From NOAA Fisheries, NOAA, and Dept. of Commerce,
A final rule in the Federal Register, 8 November 1999 (Volume 64, Number 215)

Summary:
This final rule defines the term “harm”, which is contained in the definition of *take* in the Endangered Species Act. The purpose of this rulemaking is to clarify the type of harm that may result in a *take* of a listed species under the ESA. This is not a change in existing law. It provides clear notification to the public that habitat modification or degradation may harm listed species and, therefore, constitutes a *take* under the ESA as well as ensuring consistency between NMFS and USFWS. This rule defines the term “harm” to include any act, which actually kills or injures fish or wildlife. Such acts may include significant habitat modification or degradation that significantly impairs essential behavioral patterns of fish or wildlife.

Activities That May Constitute a *take*:
A principal purpose of this final rule is to provide clear notification to parties that habitat modification or degradation may harm listed species and, therefore, constitute a *take* under the ESA. The following list identifies several examples of habitat-modifying activities that may fall within the scope of this final rule when these or similar activities cause death or injury to fish or wildlife, including those activities that significantly impair essential behavioral patterns of listed species. In all instances, a causal link must be established between the habitat modification and the injury or death of listed species. This list is not exhaustive:

- Constructing or maintaining barriers that eliminate or impede a listed species’ access to habitat or ability to migrate.
- Discharging pollutants, oil, toxic chemicals, radioactivity, carcinogens, mutagens, teratogen, or organic nutrient-laden water including sewage water into a listed species’ habitat.
- Removing, poisoning, or contaminating plants, fish, wildlife, or other biota required by the listed species for feeding, sheltering, or other essential behavioral patterns.
Part Three—Information on Listed Species

- Removing or altering rocks, soil, gravel, vegetation, or other physical structures that are essential to the integrity and function of a listed species’ habitat.

- Removing water or otherwise altering streamflow when it significantly impairs spawning, migration, feeding, or other essential behavioral patterns.

- Releasing non-indigenous or artificially propagated species into a listed species’ habitat or where they may access the habitat of a listed species.

- Constructing or operating dams or water diversion structures with inadequate fish screens or fish passage facilities at dams or water diversion structures in a listed species’ habitat.

- Constructing, maintaining, or using inadequate bridges, roads, or trails on stream banks or unstable hill slopes adjacent or above a listed species’ habitat.

- Conducting timber harvest, grazing, mining, earth moving or other operations, which result in substantially increased sediment input into streams.

- Conducting land-use activities in riparian areas and areas susceptible to mass wasting and surface erosion, which may disturb soil and increase sediment delivered to streams, such as logging, grazing, farming, and road construction.

19.5 Considerations for Projects That May Have Fisheries Impacts

- Projects that have no effect or are not likely to adversely affect listed or proposed go through the agency review process much faster and smoother than projects that will result in an adverse effect. Projects that restrict in-water work within the appropriate work window will minimize impacts on fish species, and will be more likely to have a "not likely to adversely affect" call. Work in systems that have listed resident fish species such as bull trout or steelhead may not have an impact-free window.

- Minimize the impacts from the project by obtaining a hydraulic project approval (HPA) permit from the Washington Department of Fish and Wildlife (WDFW), and include the conditions of the HPA in the BA impact minimization measures.
Projects requiring new culverts or other fish-friendly engineering should use WDFW guidelines. WDFW Habitat and Lands Program, Environmental Engineering Division is a good source for engineering information. Water Crossing Design Guidelines can be obtained on the WDFW website: <https://wdfw.wa.gov/publications/01501>.

Projects that include in-water work, such as slope stabilization in stream or river systems, should follow the Integrated Streambank Protection Guidelines, which is published by WDFW and can be obtained on the WDFW website: <https://wdfw.wa.gov/publications/00046>.

Projects that require the placement of riprap within the ordinary high water mark minimize impacts by covering an equal or larger area of riprap and restoring the stream channel in close proximity to the new riprap. Replacement of existing riprap with new riprap should include design criteria from the Integrated Streambank Protection Guidelines (WDFW).

Stormwater impacts must be considered in the BA. Projects should follow the guidance of an approved stormwater manual. Items which require special consideration include treatment to remove contaminants and release rates. The stormwater guidance provided in the WSDOT Instructional Letter (Section 5.6) should be followed when possible.

Best management practices (BMPs) for erosion and sedimentation control, spill cleanup plans, etc., for the project should come from a Department of Ecology approved plan for erosion control, spill prevention, stormwater, or the WSDOT Highway Runoff Manual. The need to follow these manuals can be listed as a recommendation in the BA. In many cases, these manuals are already being used.

Example:

A temporary erosion and sedimentation control (TESC) plan in accordance with the WSDOT Highway Runoff Manual will be developed and implemented for all projects requiring grading, ditching, filling, embankment compaction, or excavation. The best management practices in the plan will be used to control sediments from all vegetation or ground disturbing activities.

19.8 Recovery Plans

USFWS Recovery Plans

The following website is an invaluable resource for locating and downloading several existing USFWS recovery plans: <http://www.fws.gov/endangered/species/recovery-plans.html> The plans available at this online source (from the years 1983 through 2018) that are most applicable to projects located in Washington State are as follows:

Part Three—Information on Listed Species

NMFS Recovery Plans

Recovery plans are also available on the NMFS website at <https://www.fisheries.noaa.gov/national/endangered-species-conservation/recovery-species-under-endangered-species-act>.

Non-salmonids

The plans available on this website that are most applicable to projects occurring in Washington State are as follows:

- Final Recovery Plan for the Humpback Whale, November 1991

Salmonids

In addition, several recovery plans have been finalized or are in development for Pacific Northwest Salmonids. Information on these plans is available on the NMFS website: <https://www.fisheries.noaa.gov/national/endangered-species-conservation/recovery-species-under-endangered-species-act>

tshawytscha) and Snake River Steelhead (Oncorhynchus mykiss). NMFS West Coast Region, Seattle, Washington. October 2016.

- National Marine Fisheries Service. 2007. Final Hood Canal and Eastern Strait of Juan de Fuca Summer Chum Salmon Recovery Plan adopted by NMFS.
